

CLEAN AIR

**IN THE AGRO AND MILLING INDUSTRY**

**DEDICATED  
TO CLEAN AIR**

## We know the agro and milling industry – so do our dealers

When JKF was founded more than 50 years ago, it was the agro and milling industries that it first targeted for its customers.

Today, the agro and milling industry is still a substantial customer segment where we supply complete solutions of high quality components for process extraction which include filters, cyclones, rotary valves, stainless ducts, standard ducts, fans, special products and accessories.

” Excellent quality products, short delivery times and at fair prices – what more could you want from a supplier...

**Keith Weavin**, managing director,  
Truduct Products Ltd.

Therefore, we know the industry's basic needs and requirements to the functionality of our products and of course the legislation which is in force.

It is regardless of whether it is equipment for the agricultural and milling industry, silo plants or solutions which target some of the world's largest companies in the industry.

The same experience is applied from our professional network of hand-picked dealers who supply individual and custom-built ventilation and extraction solutions, which ensure clean air for the benefit of the employees, the environment, safety and the reliability of the machines in the production process.

## Dust is bad for the working environment and makes cleaning difficult – Clean air increase the efficiency

When the agro and milling industry are working with different raw materials – e.g. grain, seeds, rice, sugar and coffee – large amounts of dust of varying particle sizes are produced.

The smallest particles tend to move around in the premises atmosphere. This dries out and irritates the employees' mucous membranes, eyes, skin and respiratory system. The heavier particles land on the machinery and the floor making hard work of the routine cleaning and maintenance.

It is at the expense of the working environment which generates this significant discomfort for the employees resulting in increased absence from work due to illness

and therefore reduced efficiency in the company.

Based on the Danish Working Environment Act we supply – in co-operation with our dealers – efficient and custom-built extraction and ventilation systems which target the challenges and specific requirements of the agro and milling industries, including the requirement for cleaning. All JKF's components are designed to be easily cleaned.

The benefit is a unique combination of good working environment, sustainability, improved products, easy cleaning and maintenance, and a positive impact on the company's profitability.

## Minimize the risk of explosion and production downtime

For many years JKF has been the market leader within explosion protection. With the introduction of the European ATEX-directive in conjunction with working environment, this area of safety has been additionally highlighted.

ATEX is a French abbreviation of "ATmosphère EXplosif" which relates to protective devices and systems used in atmospheres with a danger of explosion (gas or dust).

The ATEX-directive is especially comprehensive in the agro and milling industry, where it

covers dust in the same way as flammable gases. Here the correct extraction systems play a fundamental role. At the same time, reduced dust in the production process means far more reliable machinery and minimizes downtime which have economic consequences.

## A complete range of products – which reflects on the bottom line

JKF's range of products include filters, filter bags, stainless ducts, cyclones, rotary valves, standard ducts, fans, special products and accessories all of which are all used in process extraction systems.

The products are carefully selected to suit our customer's needs and requirements and

we can supply both small and large solutions at budgets to suit the customer.

Common to all our products is the focus on safety, environment, noise, performance, efficiency, reduction of costs and energy consumption. Designed to provide a competitive time of repayment of the total investment cost they all have a positive effect on the company's bottom line.

Furthermore, all our products are designed in a way so they can not only be used in a total JKF-solution but also used together with other manufactures.

JKF will of course provide documentation for majority of processes and products through its diversity of ISO-certificates.
